

Depression in Older Adults

Recognizing the Signs of Elderly Depression and Getting Treatment

Have you lost interest in the activities you used to enjoy? Do you struggle with feelings of helplessness and hopelessness? Are you finding it harder and harder to get through the day? If so, you're not alone. Depression can happen to any of us as we age, regardless of our background or achievements. But depression is far from an inevitable part of getting older. With the right support, treatment, and self-help strategies you can boost the way you feel, cope better with life's changes, and make your senior years a healthy, happy, and fulfilling time.

Are you an older adult with depression?

Depression is a common problem in older adults. And the symptoms of elderly depression can affect every aspect of your life, impacting your energy, appetite, sleep, and interest in work, hobbies, and relationships.

Unfortunately, all too many depressed older adults fail to recognize the symptoms of depression, or don't take the steps to get the help they need. There are many reasons that elderly depression is so often overlooked:

- ▶ You may assume you have good reason to be down or that depression is just part of aging.
- ▶ You may be isolated—which in itself can lead to depression—with few around to notice your distress.

- ▶ You may not realize that your physical complaints are signs of depression.
- ▶ You may be reluctant to talk about your feelings or ask for help.

You can feel good at any age

Depression isn't a sign of weakness or a character flaw. It can happen to anyone, at any age, no matter your background or your previous accomplishments in life. While life's changes as you age—such as retirement, the death of loved ones, declining health—can sometimes trigger depression, they don't have to keep you down. No matter what challenges you face as you age, there are steps you can take to feel happy and hopeful once again and enjoy your golden years.

Signs and symptoms of depression in older adults and the elderly

Recognizing depression in the elderly starts with knowing [the signs and symptoms](/articles/depression/depression-symptoms-and-warning-signs.htm) (/articles/depression/depression-symptoms-and-warning-signs.htm). Depression red flags include:

- ▶ Sadness or feelings of despair
- ▶ Unexplained or aggravated aches and pains
- ▶ Loss of interest in socializing or hobbies
- ▶ Weight loss or loss of appetite
- ▶ Feelings of hopelessness or helplessness
- ▶ Lack of motivation and energy
- ▶ Sleep disturbances (difficulty falling asleep or staying asleep, oversleeping, or daytime sleepiness)
- ▶ Loss of self-worth (worries about being a burden, feelings of worthlessness or self-loathing)
- ▶ Slowed movement or speech
- ▶ Increased use of alcohol or other drugs
- ▶ Fixation on death; thoughts of suicide
- ▶ Memory problems
- ▶ Neglecting personal care (skipping meals, forgetting meds, neglecting personal

- ▶ hygiene)

Depressed older adults may not feel “sad”

While depression and sadness might seem to go hand and hand, many depressed seniors claim not to feel *sad* at all. They may complain, instead, of low motivation, a lack of energy, or physical problems. In fact, physical complaints, such as arthritis pain or worsening headaches, are often the predominant symptom of depression in the elderly.

Is it grief or depression?

As we age, we experience many losses. Loss is painful—whether it’s a loss of independence, mobility, health, your long-time career, or someone you love. [Grieving over these losses is normal and healthy](#) (/articles/grief/coping-with-grief-and-loss.htm), even if the feelings of sadness last for a long time.

Distinguishing between grief and clinical depression isn’t always easy, since they share many symptoms. However, there are ways to tell the difference.

- Grief is a roller coaster involving a wide variety of emotions and a mix of good and bad days. Even when you’ll still have moments of pleasure or happiness.
- With depression, on the other hand, the feelings of emptiness and despair are constant.
- While there’s no set timetable for grieving, if it doesn’t let up over time or extinguishes all signs of joy—laughing at a good joke, brightening in response to a hug, appreciating a beautiful sunset—it may be depression.

Causes of depression in older adults

As we grow older, we often face significant life changes that can increase the risk for depression. These can include:

- ▶ **Health problems** – Illness and disability; chronic or severe pain; cognitive decline; damage to your body image due to surgery or sickness.
- ▶ **Loneliness and isolation** – Living alone; a dwindling social circle due to deaths or relocation; decreased mobility due to illness or a loss of driving privileges.
- ▶ **Reduced sense of purpose** – Feelings of purposelessness or loss of identity due to retirement or physical limitations on activities you used to enjoy.

- ▶ **Fears** – Fear of death or dying; anxiety over financial problems or health issues.
- ▶ **Recent bereavements** – The death of friends, family members, and pets; the loss of a spouse or partner.

Medical conditions that can cause elderly depression

It's important to be aware that medical problems can cause depression in older adults and the elderly, either directly or as a psychological reaction to the illness. Any chronic medical condition, particularly if it is painful, disabling, or life-threatening, can lead to depression or make your depression symptoms worse.

These include:

- ▶ Parkinson's disease
- ▶ Stroke
- ▶ Heart disease
- ▶ Cancer
- ▶ Diabetes

- ▶ Thyroid disorders
- ▶ Vitamin B12 deficiency
- ▶ [Dementia](/articles/alzheimers-dementia-aging/living-with-dementia.htm) (/articles/alzheimers-dementia-aging/living-with-dementia.htm) and [Alzheimer's disease](/articles/alzheimers-dementia-aging/alzheimers-disease.htm) (/articles/alzheimers-dementia-aging/alzheimers-disease.htm)
- ▶ Lupus
- ▶ Multiple sclerosis (MS)

Elderly depression as a side effect of medication

Symptoms of depression can also occur as a side effect of many commonly prescribed drugs. You're particularly at risk if you're taking multiple medications. While the mood-related side effects of prescription medication can affect anyone, older adults are more sensitive because, as we age, our bodies become less efficient at metabolizing and processing drugs.

If you feel depressed after starting a new medication, talk to your doctor. You may be able to lower your dose or switch to another medication that doesn't impact your mood.

Medications that can cause or worsen depression include:

- ▶ Blood pressure medication (e.g. clonidine)
- ▶ Beta-blockers (e.g. Lopressor, Inderal)
- ▶ High-cholesterol drugs (e.g. Lipitor, Mevacor, Zocor)
- ▶ Tranquilizers (e.g. Valium, Xanax, Halcion)
- ▶ Calcium-channel blockers
- ▶ Medication for Parkinson's disease
- ▶ [Sleeping pills](/articles/sleep/sleeping-pills-and-natural-sleep-aids.htm) (/articles/sleep/sleeping-pills-and-natural-sleep-aids.htm)
- ▶ Ulcer medication (e.g. Zantac, Tagamet)
- ▶ Heart drugs containing reserpine
- ▶ Steroids (e.g. cortisone and prednisone)
- ▶ Painkillers and arthritis drugs
- ▶ Estrogens (e.g. Premarin, Prempro)

Dementia vs. depression

Never assume that a loss of mental sharpness is just a normal sign of old age. It could be a sign of either depression or dementia, both of which are common in older adults. Depression and dementia share many similar symptoms, including [memory problems](/articles/alzheimers-dementia-aging/age-related-memory-loss.htm) (/articles/alzheimers-dementia-aging/age-related-memory-loss.htm), sluggish speech and movements, and low motivation, so it can be difficult to tell the two apart.

Is it Depression or Dementia?	
Symptoms of Depression	Symptoms of Dementia
Mental decline is relatively rapid	Mental decline happens slowly
Know the correct time, date, and where you are	Be confused and disoriented; become lost in familiar locations
Difficulty concentrating	Difficulty with short-term memory
Language and motor skills are slow, but normal	Writing, speaking, and motor skills are impaired

Is it Depression or Dementia?

You notice or worry about memory problems

You don't notice memory problems or seem to care

(</articles/alzheimers-dementia-aging/age-related-memory-loss.htm>)

[Age-Related Memory Loss: \(/articles/alzheimers-dementia-aging/age-related-memory-loss.htm\)](/articles/alzheimers-dementia-aging/age-related-memory-loss.htm) What's Normal, What's Not and When to Seek Help

Whether cognitive decline is caused by dementia or depression, it's important to see a doctor right away. If it's depression, memory, concentration, and energy will bounce back with treatment. Treatment for dementia will also improve your quality of life. And in some types of dementia, symptoms can be reversed, halted, or slowed.

Self-help for elderly depression

It's a myth to think that after a certain age older adults can't learn new skills, try new activities, or make fresh lifestyle changes. The truth is that the human brain never stops changing, so as an older adult, you're just as capable as a young person of learning new things and adapting to new ideas that can help you recover from depression.

Overcoming depression involves finding new things you enjoy, learning to adapt to change, staying physically and socially active, and feeling connected to your community and loved ones.

Of course, when you're depressed, taking action and putting self-help steps into action can be hard. Sometimes, just thinking about the things you should do to feel better can seem overwhelming. But small steps can make a big difference to how you feel. Taking a short walk, for example, is something you can do right now—and it can boost your mood for the next two hours. By [taking small steps day by day \(/articles/depression/coping-with-depression.htm\)](/articles/depression/coping-with-depression.htm), your depression symptoms will ease and you'll find yourself feeling more energetic and hopeful again.

Self-help tip 1: Find ways to stay engaged

If you're depressed, you may not want to do anything or see anybody. But isolation and disconnection only make depression worse. The more engaged you are—socially, mentally, and physically—the better you'll feel.

Seek out face-to-face connection

On your own, it can be difficult to maintain perspective and sustain the effort required to beat depression. That's why support matters—so make an effort to connect to others and limit the time you're alone. If you can't get out to socialize, invite loved ones to visit you, or keep in touch over the phone or email.

But digital communication isn't a replacement for face-to-face contact. Do your best to see people in person on a daily basis. Your mood will thank you! And remember, it's never too late to [build new friendships](#) (/articles/relationships-communication/making-good-friends.htm). Start by joining a senior center, a book club, or another group of people with similar interests.

Ways to feel connected and engaged

To overcome depression—and stop it coming back—it's important to continue to feel engaged and enjoy a strong purpose in life. As we age, life changes and we lose things that previously occupied our time and gave our life meaning. You may retire, for example, or your children may leave home, or friends may move away. But there are still plenty of ways you can find new meaning in life and continue to feel connected and engaged.

Get out in to the world. Try not to stay cooped up at home all day. Go to the park, take a trip to the hairdresser, have lunch with a friend, visit a museum, or go to a concert or a play.

Volunteer your time. [Helping others](#) (/articles/healthy-living/volunteering-and-its-surprising-benefits.htm) is one of the best ways to feel better about yourself and expand your social network.

Join a depression support group. Being with others facing the same problems can help reduce your sense of isolation. It can also be inspiring to hear how others cope with depression.

Take care of a pet A pet can keep you company, and [walking a dog](#) (/articles/mental-health/mood-boosting-power-of-dogs.htm), for example, can be good exercise for you and a great way to meet people. Dog owners love to chat while their pets play together.

Learn a new skill. Pick something that you've always wanted to learn, or that sparks your imagination and creativity—a musical instrument, a foreign language, or a new game or sport, for example. Take a class or join a club to meet like-minded people.

Create opportunities to laugh. [Laughter provides a mood boost \(/articles/mental-health/laughter-is-the-best-medicine.htm\)](#), so swap humorous stories and jokes with your loved ones, watch a comedy, or read a funny book.

Tip 2: Adopt healthy habits

When you're depressed, it can be hard to find the motivation to do anything—let alone look after your health. But your health habits have an impact on depression symptoms. The better care you take of your body, the better you'll feel.

Move your body

Exercise is a powerful depression treatment. In fact, research suggests it can be just as effective as antidepressants. And you [don't have to suffer through a rigorous workout \(/articles/healthy-living/exercise-and-fitness-as-you-age.htm\)](#) to reap the benefits. Take a short walk now and see how much better you feel. Anything that gets you up and moving helps. Look for small ways to add more movement to your day: park farther from the store, take the stairs, do light housework, or enjoy a short walk. It all adds up.

Even if you're ill, frail, or disabled, there are many [safe exercises \(/articles/healthy-living/chair-exercises-and-limited-mobility-fitness.htm\)](#) you can do to build your strength and boost your mood—even from a chair or wheelchair. Just listen to your body and back off if you're in pain.

Eat to support your mood

Your dietary habits make a difference with depression.

- ▶ Start by [minimizing sugar and refined carbs \(/articles/healthy-eating/choosing-healthy-carbs.htm\)](#). Sugary and starchy comfort foods can give you a quick boost, but you pay for it later when your blood sugar crashes.
- ▶ Instead, focus on quality protein, complex carbs, and [healthy fats \(/articles/healthy-eating/choosing-healthy-fats.htm\)](#), which will leave you satisfied and emotionally balanced.
- ▶ Going too long without eating can also worsen your mood, making you tired and irritable, so do your best to eat something at least every 3-4 hours.

Support quality sleep

(/articles/sleep/how-to-sleep-well-as-you-age.htm)

[Sleep Tips for Older Adults](/articles/sleep/how-to-sleep-well-as-you-age.htm): (/articles/sleep/how-to-sleep-well-as-you-age.htm) Learn to Sleep Better

Many older adults struggle with sleep problems, particularly insomnia. But lack of sleep makes depression worse. Aim for somewhere between 7 to 9 hours of sleep each night. You can help yourself get better quality sleep by avoiding alcohol and caffeine, keeping a regular sleep-wake schedule, and making sure your bedroom is dark, quiet, and cool.

Spend time in sunlight

Sunlight can help boost serotonin levels, improve your mood, and cope with [Seasonal Affective Disorder](/articles/depression/seasonal-affective-disorder-sad.htm) (SAD).

Whenever possible, get outside during daylight hours and expose yourself to the sun for at least 15 minutes a day.

- ▶ Have your coffee outside or by a window, enjoy an al fresco meal, or spend time gardening.
- ▶ Exercise outside by hiking, walking in a local park, or playing golf with a friend.
- ▶ If you live somewhere with little winter sunshine, try using a light therapy box.

Alcohol and depression in older adults

It can be tempting to use alcohol to deal with physical and emotional pain. It may help you take your mind off an illness, feel less lonely, or get to sleep. But alcohol makes symptoms of depression and anxiety worse over the long run. It also impairs brain function and interacts in negative ways with numerous medications, including antidepressants. And while drinking may help you nod off, it also keeps you from getting the refreshing deep sleep you need.

Tip 3: Know when to seek professional help

Depression treatment is just as effective for older adults as it is for younger people. However, since depression in the elderly is often triggered or compounded by a difficult life situation or challenge, any treatment plan should address that issue. If loneliness is at the root of your depression, for example, medication alone is not going to cure the problem. Also, any medical issues complicating the depression must be addressed.

Antidepressant risk factors

Older adults are more sensitive to drug side effects and vulnerable to interactions with other medicines they're taking. Studies have also found that SSRIs such as Prozac can cause rapid bone loss and a higher risk for fractures and falls. Because of these safety concerns, elderly adults on [antidepressants](/articles/depression/antidepressant-medication.htm) (/articles/depression/antidepressant-medication.htm) should be carefully monitored.

In many cases, therapy and/or healthy lifestyle changes, such as [exercise](/articles/healthy-living/exercise-and-fitness-as-you-age.htm) (/articles/healthy-living/exercise-and-fitness-as-you-age.htm), can be as effective as antidepressants in relieving depression, without the dangerous side effects.

Counseling and therapy

[Therapy](/articles/mental-health/finding-a-therapist-who-can-help-you-heal.htm) (/articles/mental-health/finding-a-therapist-who-can-help-you-heal.htm) works well on depression because it addresses the underlying causes of the depression, rather than just the symptoms.

- ▶ **Supportive counseling** includes religious and peer counseling. It can ease loneliness and the hopelessness of depression, and help you find new meaning and purpose.
- ▶ **Therapy** helps you work through stressful life changes, heal from losses, and process difficult emotions. It can also help you change negative thinking patterns and develop better coping skills.
- ▶ **Support groups** for depression, illness, or bereavement connect you with others who are going through the same challenges. They are a safe place to share experiences, advice, and encouragement.

How to help an older adult with depression

The very nature of depression interferes with a person's ability to seek help, draining energy and self-esteem. For depressed seniors, raised in a time when mental illness was highly stigmatized and misunderstood, it can be even more difficult—especially if they don't believe depression is a real illness, are too proud or ashamed to ask for assistance, or fear becoming a burden to their families.

If an elderly person you care about is depressed, you can make a difference by offering emotional support. Listen to your loved one with patience and compassion. You don't need to try to "fix" someone's depression; just being there to listen is enough. Don't criticize feelings expressed, but point out realities and offer hope. You can also help by seeing that your loved one gets an accurate diagnosis and appropriate treatment. Help your loved one find a good doctor, accompany them to appointments, and offer moral support.

Other tips for helping a depressed elderly loved one

Invite your loved one out. Depression is less likely when people's bodies and minds remain active. Suggest activities to do together that your loved one used to enjoy: walks, an art class, a trip to the movies—anything that provides mental or physical stimulation.

Schedule regular social activities. Group outings, visits from friends and family members, or trips to the local senior or community center can help combat isolation and loneliness. Be gently insistent if your plans are refused: depressed people often feel better when they're around others.

Plan and prepare healthy meals. A poor diet can make depression worse, so make sure your loved one is eating right, with plenty of fruit, vegetables, whole grains, and some protein at every meal.

Encourage the person to follow through with treatment. Depression usually recurs when treatment is stopped too soon, so help your loved one keep up with his or her treatment plan. If it isn't helping, look into other medications and therapies.

Make sure all medications are taken as instructed. Remind the person to obey doctor's orders about the use of alcohol while on medication. Help them remember when to take their dose.

Watch for suicide warning signs. Seek immediate professional help if you suspect that your loved one is [thinking about suicide](/articles/suicide-prevention/suicide-prevention.htm) (/articles/suicide-prevention/suicide-prevention.htm).
